Transport Surveys

Ports, airports, motorways, railways and other major infrastructure assets are costly to construct and vital for a country's successful development. Careful risk management and well structured insurance of physical assets and associated operations is important. Charles Taylor technical (CTt) is regularly involved in surveys of many types of transport infrastructure worldwide supported by the office network and specialist operational expertise of the CTC Group. Surveys can cover the construction stage or operations as well as liability and business interruption risks.
